

ABSTRACT OF THE DISCLOSURE

There are provided an information storage apparatus
and an information reproducing method capable of reading a
5 mark without being disturbed by cross talk even if a track
pitch is narrow.

If reading a mark has failed in a region on an
information storage medium, a recording state in a region
adjacent to that region is changed to reduce cross talk (step
10 S102), and thereafter reading of the mark is again executed
(step S103).
